

ABSTRACT OF THE DISCLOSURE

An information processing apparatus restricts admission to space occupied by a user in a virtual space. When a second user of a second terminal makes a request for admission to space which is in the virtual space and which is occupied by a first user of a first terminal, a space management server transmits data to the first user causing
5 the first user to recognize that the request for admission is made by the second user. In response to an action based on the data, the first user performs an operation. If the first user performs an operation to permit the second user admission to the space, the second user can enter the space occupied by the first user.
